

FORCED AIR CAB CIRCULATING FANS

The design, development and installation of forced fresh air circulating fan assembly into an existing fleet

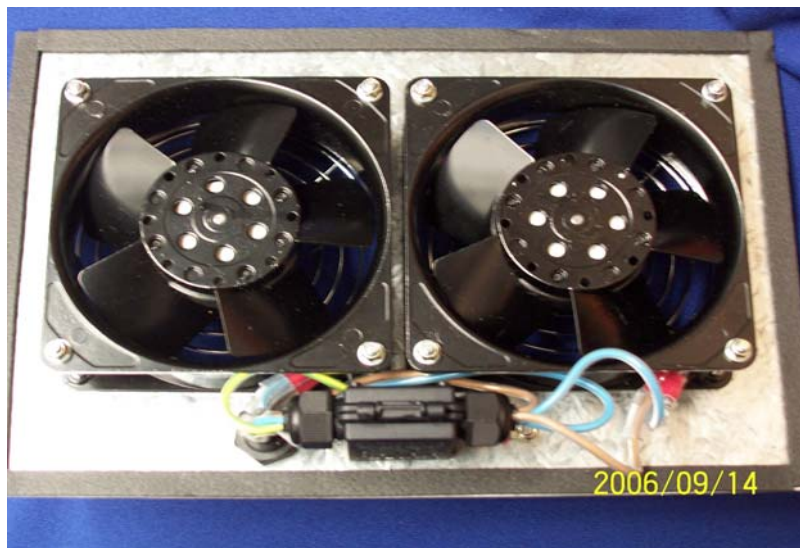

The design, development and installation of forced fresh air circulating fan assembly for the guard as well as the driver compartment on the set fleet.

The complete assembly was developed at Caspian Technology Rail division from the basic requirement and criteria set out by RailCorp and MainTrain.

The design process was influenced by the potentially water laden intake air and all of the air exposed parts had to be designed in such a way that the maximum IP can be achieved and in many cases stainless steel and sealed equipment and parts had to be deployed.
